

How Bavarian Cities adapt to Climate Change: The example of Munich

Prof. Dr. Julia Laube, Dr. Veronika Wirth, Dr. Teresa Zölich, Paul Depner

Joint Talk HSWT & City of Munich, Department Climate & Environment

04.11.2021

Setting

- Densely populated
- 1.56 Mio citizens (2020), increase ca. 20.000/year
- High percentage of soil sealing
- Strong urban heat island effect, heavy rain events

Current climate & trends

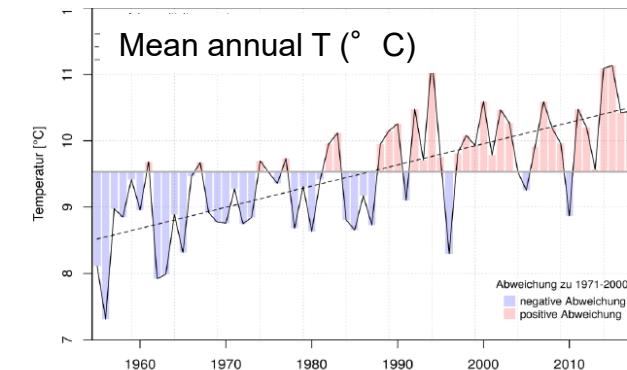

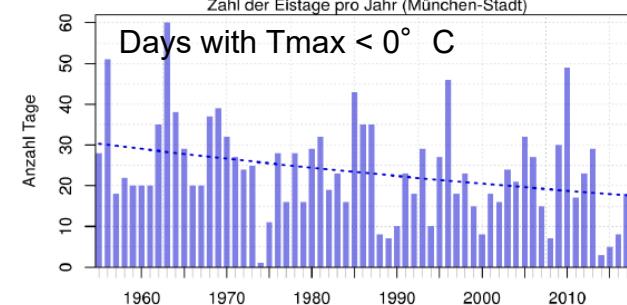

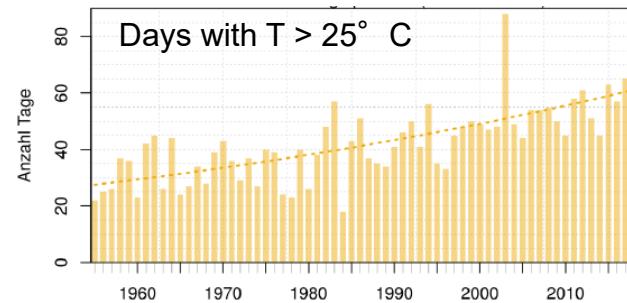

Temp
at 14:00 CET
summerday

Setting

- Excellent data
- Models of current climate & predictions
- Knowledge on vulnerable, unfavourable sites as well as on sites with high impact on cities' climate
- Political will to act

Decisions of the City Council

- 2013: develop a climate change adaptation strategy for the city
- 2014: sign Mayors Adapt
- 2016: implement adaptation strategy & action plan including funds needed
- 2019: climate emergency announced
- 2021: monitor & update adaptation strategy
- 2021: climate budget 100 Mio € / year to get climate-neutral & climate change adaptation

Konzept zur Anpassung an die Folgen des Klimawandels in der Landeshauptstadt München

Climate Change Adaptation Strategy

Impact assessment

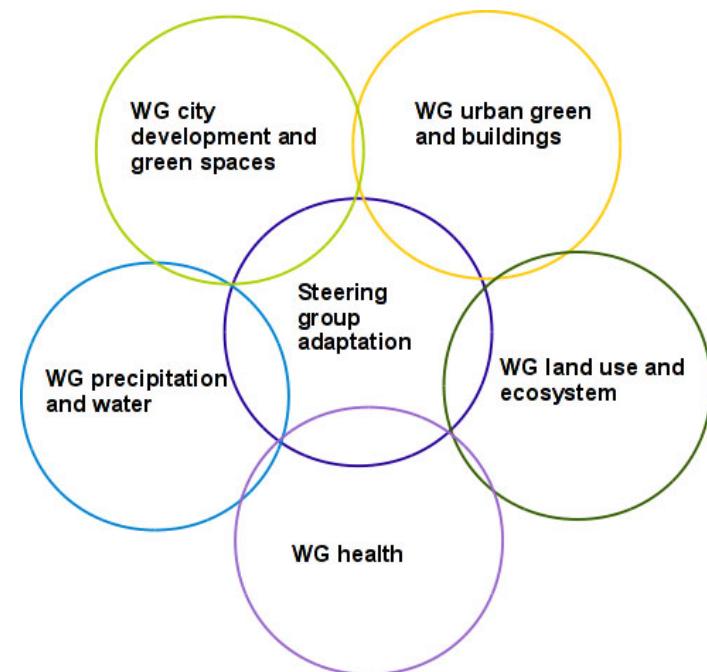

26 measures

Process monitoring

Structure: Working groups

more than 60 participants
from 7 administrative units

Impact assessment

	Increasing mean temperatures	Rising extreme temperatures	Increasing number of nights >20°C	Dry periods	Changing rain patterns*	Increasing heavy precipitation events*	Storms*	Extreme events e.g. hail, freezing rain**
City development and green spaces (district level)		- increasing heat stress - green spaces: increasing requirements	- no recreation during the night			- local flooding, - infiltration		- damage of houses and infrastructure
Urban green and buildings (object level)	- plant selection	- worse living and working climate - green spaces: increasing requirements	- no recreation during the night	- selection of plants and substrat - increasing demand for water and maintenance		- local flooding, - damage of houses	- damage of houses and infrastructure	- damage of houses and infrastructure
Health	- Increase in allergies, - Increase in infectious diseases	- increase in cardiovascular diseases - increase in respiratory diseases	- increase in cardiovascular diseases					
Water management	- Rising water temperatures			- fluctuating ground water level	- risk of flooding changes - rising ground water level, rising temperature	- risk of flooding changes, local flooding - rising ground water level, rising temperature		
Agriculture/ forestry	- longer vegetation period - changing growth conditions	- heat stress		- dry stress - danger of forest fires	- possible yield losses	- possible yield losses	- forest damage	- possible yield losses, damages

	Considerable negative impacts
	Moderate negative impacts
	Positive impacts

* still uncertainties in projections for future development

** still very considerable uncertainties concerning future development. Modelling efforts are still at the beginning.

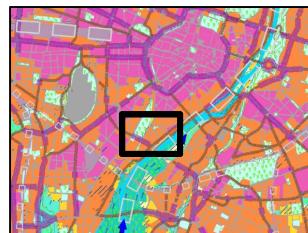

Measures

- Adaptation of existing spatial **planning instruments**
- **Simulations** for exemplary urban climate issues
- Adaptation measures for **trees** (tree stands, tree species)
- **Information for house builder** on heavy precipitation, **grants for greening** of private buildings/gardens
- Define **quality standards** for urban green
- Improving **data base for extreme events**
- **Restoration of rivers and streams**
- Retrofit of **emergency fountains**
- Assessing vulnerability of **care facilities and hospitals**
- **Information for public / vulnerable groups:** What to do during heat waves

Adaptation of spatial planning instruments

1st planning step

e.g. urban design competitions, structural concepts, change of land-use plans

Early screening based on climate map:
Climatic functions? Air exchange?
If climate sensitive:
Advise further actions

2nd planning step

e.g. master plan, project-related zoning plan

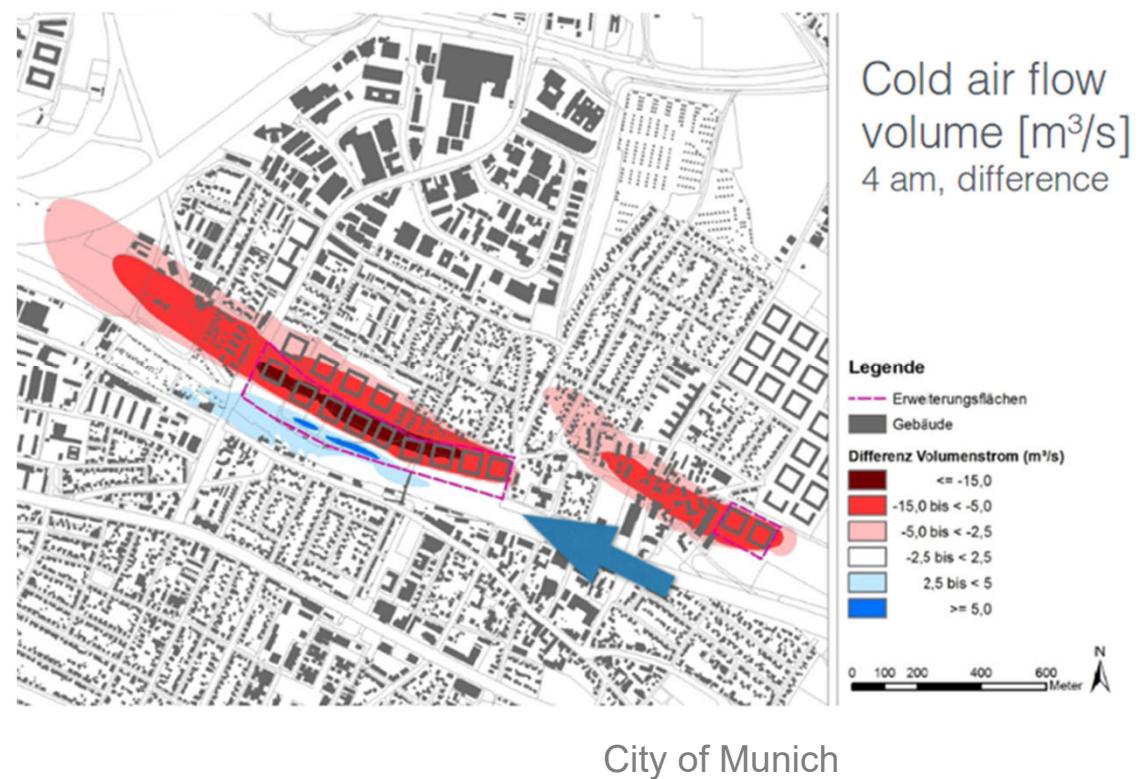

Screening based on climate map:
Climatic functions? Air exchange?
Current bioclimatic conditions?
If climate sensitive:
Micro-climatic assessment,
Optimisation, Advise changes

Adaptation of spatial planning instruments

Detailed micro-climatic assessment and scenario modelling in climate-sensitive cases

Deduction of climate criteria for urban design competitions

Optimisation of buildings (size, location, massing)

Preliminary conclusions

- Many climate change topics, vulnerabilities and chances to react are identified
- First measures implemented, further process has started
- Public attention is raised

THANKS
For your attention!
